

ABSTRACT OF THE DISCLOSURE

As the usage of computers increase in our daily lives, the hazards of keyboard and mouse usage also have increased proportionately. This new keyboard design is an effort to reduce the damage caused to the hand. The main feature of this design is the integration of keyboard and mouse into a single board in a very user-friendly way leaving the current functionality completely intact. Also, an alternative to mouse clicks has been provided via the usage of keys. Elimination of a peripheral device may be cost effective as well.
